6. (Currently Amended) An active noise control system comprising:
a microphone positioned in the passenger compartment of a vehicle having a fixed roof, the microphone being centrally located on the fixed roof of the vehicle at an antinode of a primary or secondary acoustic normal mode of the passenger compartment of the vehicle for detecting said noise of which sound pressure level is high and for generating an output signal;

canceling sound generating means disposed in the passenger compartment for generating a noise canceling sound;

a feedback control circuit for being supplied with ~~an output~~ the output signal from said microphone highly correlated to noise from a noise source and generating a noise cancellation signal which is out of phase to noise in the passenger compartment of the

~~vehicle with the fixed roof for energizing and generating an output signal to energize~~

said canceling sound generating means; and

a storage box,

wherein said microphone and said feedback control circuit are housed together in said storage box, said feedback control circuit having an adjusting circuit for adjusting the amplitude and phase between ~~a canceling~~ the canceling sound generating means and the microphone, based on a transfer characteristic from said microphone, to generate a noise cancellation signal which is of the same sound pressure as, but out of phase to, noise at the microphone.
